

Distributed Denial of Service **Attacks**

DDoS attacks can be some of the most disruptive attacks a business experiences. Web servers could crash and may not recover for days bringing applications and revenue to a screeching halt. Hackers use spam, viruses and other malware to crowd out useful traffic on your network, such as business emails or customers visiting websites to place an order, with false traffic.

More than **2,000 AT&T security experts** around the globe armed with the latest tools to **monitor petabytes of IP traffic** every day, 24x7, for suspicious activity.
