What is a MPLS VPN?

Multiprotocol Label Switching (MPLS) is a standards-based technology used to prioritize the delivery of network packets creating a Virtual Private Network (VPN).
VPN security and flexibility

Benefits

• Application awareness
• Scalability
• Agile, reliable, flexible any-to-any connectivity
• Easy access to reporting/tools
• Industry-leading service level agreements
• Meshed network with class of service
• Built-in disaster recovery
• Flexible Management options

Top 3 advantages of a MPLS VPN

Be connected virtually anytime, anywhere and with any device utilizing a single private IP network.

Application enablement

• Compatible and flexible service components
• Easily add applications over IP
• Multiple access options

Security capabilities

• Network monitoring for potential security threats while executing corrective actions
• Compliance with Industry Standards and Regulations, such as Payment Card Industry (PCI)
• Value added security options which include Managed Firewall and Intrusion Protection

Wireless integration

• Mobile devices are an extension of corporate VPN
• Remote access virtually anywhere, on any device
• Single global client, in many operating systems, with same user experience
