AT&T Secure Networking

**Powering a flexible & reliable network.**

Massive increases in data traffic, the soaring popularity of mobile devices and the migration to cloud applications are taking telecommunications to a new level. Businesses need a network that can deliver self-service portals, reliable broadband and scalable solutions. A network that’s more flexible. More dynamic.

We give you the network you need to run your business today, and address the challenges you’ll face tomorrow. We can cover you in the US, and in most of the world. One location or thousands. Agility, flexibility and performance. That’s what we deliver.

With AT&T, it’s not one size fits all. Our solutions can be combined in different ways to support whatever your business requires.

- **MPLS Solutions**
  - Connect multiple sites using a virtual private network
  - Run on the AT&T Multi Protocol Label Switching (MPLS) backbone
  - Governed by a Service Level Agreement

- **Broadband Solutions**
  - Integrate remote sites with a core network
  - Combine MPLS connectivity with Internet-based services
  - Provide for Internet offload and wireless backup

- **Multiservice Solutions**
  - Merge Wi-Fi and LAN with IPsec networking
  - Provide customizable landing pages and a web reporting portal
  - Support public Internet access at individual locations

Good option for latency sensitive applications like voice and video.

Good option for businesses that want the most cost-effective connectivity.

Good option for locations needing both VPN and Wi-Fi services.

### Benefits
- Highly-secure connections
- Scalable solutions that can be customized to meet your needs
- Support for public Wi-Fi access at customer-facing locations
- Pre-established links to cloud service providers with AT&T NetBond®

**Evolution of Secure Networking**

Networks are changing, and we’re leading the way. This ongoing transformation will enable an intelligent, dynamic and on-demand infrastructure to support the continuing evolution of both telecommunications and business itself. It’s a brand new day.

The software-defined network of the future will deliver incredible benefits. By 2020, we plan to virtualize and control over 75 percent of our network using these new software-defined architectures. That’s how we’ll meet the growing demands of data- and video-loving users.

Only AT&T Secure Networking Solutions maximize operational benefits today without limiting your flexibility tomorrow.
